

| Cost item | Type of cost | Description | Estimation issues | Risks (not exhaustive) |
|---|------------------------------------|---|--|--|
| Civil Engineering (Buildings and Plants) | Investment / capital cost | Regular building costs of offices and laboratories, including commissioning costs | <p>These costs typically include the costs related to architectural services and technical supervision</p> <p>The estimation of the construction cost should follow a thorough “value engineering exercise” in the case of a physical RI in particular</p> | Misspecification leading to adjustments and extra costs + overruns due to delays in construction |
| Scientific Equipment | Investment / capital cost | Technical Design, R&D, manufacturing, assembly/integration, configuration/change, testing, commissioning | <p>Complexity of the equipment, sometimes experimental and never done before, so no easy benchmark</p> <p>Should include additional needs (such as computing needs)</p> | Cost overruns caused by maturity risks, delays in development//delivery, currency risk |
| Personnel and training costs | Start-up costs + operational costs | Salaries + training costs | <p>Country differences (low wage-high wage) availability -peak load rigidity: the balance between in-house and outsourcing should be analyzed</p> | Low Wage country cannot deliver, personnel has to be hired in high wage country |
| Overhead, services | Start-up costs + operational costs | All costs not directly related to executing the core tasks of the RI: financial, HR, facilities like cleaning etc., but also knowledge transfer activities. | Estimation requires relevant attribution criteria to infer costs from scale of RI (no. person-hours, square meters used, type of tasks etc) | |
| Maintenance | Operational cost | Regular maintenance of | Data available on the market in | Lack of data for new equipment |

| | | | | |
|------------------------|---|---|---|---|
| | | existing material | case of industrial supplier of technology Need for ad-hoc estimation in case of new technology | + reliability of data coming from industrial supplier + market dependency in case of sole supplier of maintenance |
| Utilities | Operational cost | Electricity, gas, water, ... | Need for reliable data, in particular from technical team and industry on needed capacity and consumption. In some instances, it may be useful to internalise the supply (internal power station or gas production) or choose long-term energy-efficient approaches , set up consortia with other large consumers | Market volatility (in particular for energy), reliability of consumption data |
| Reinvestments | Investment cost | Replacement and upgrade of scientific and technological equipment | Economical / technical lifetime for experimental equipment not necessarily known, difficulty to establish a re-investment timing from the outset | Underestimation or unrealistic timing of re-investment may eventually lead to situations where the RI cannot remain competitive |
| Decommissioning | Investment cost | Dismantling the facility (handling of redundant buildings, sale of decontaminated land, equipment) | Decommissioning strategy should be established from the outset. However, many constraints (in particular regulatory) are very uncertain. | Regulatory uncertainty |
| Taxes | Attached to cost (investment or non-investment) | VAT, excise duties, local taxes, tax on generated income, taxes and contributions on personnel costs, taxes on energy, etc. | Depends very much on legal status of the RI + difficulty to predict future fiscal policy | Legal uncertainty connected to unstable fiscal policy |
